

I. Pen-and-paper

- ① (a) In keeping with the aforementioned assumptions, y_1, y_2 follows a multivariate gaussian distribution whose conditional parameters (i.e. in regard to classes A and B) are:

$$\begin{aligned} \mu_A, \mu_B, \Sigma_A \text{ and } \Sigma_B \\ \mu_A = \frac{1}{3} \left(\begin{bmatrix} 0.24 \\ 0.36 \end{bmatrix} + \begin{bmatrix} 0.46 \\ 0.48 \end{bmatrix} + \begin{bmatrix} 0.32 \\ 0.72 \end{bmatrix} \right) = \begin{bmatrix} 0.24 \\ 0.52 \end{bmatrix} \quad \mu_B = \frac{1}{4} \left(\begin{bmatrix} 0.54 \\ 0.11 \end{bmatrix} + \begin{bmatrix} 0.66 \\ 0.39 \end{bmatrix} + \begin{bmatrix} 0.36 \\ 0.28 \end{bmatrix} + \begin{bmatrix} 0.41 \\ 0.53 \end{bmatrix} \right) = \begin{bmatrix} 0.5925 \\ 0.3275 \end{bmatrix} \\ \Sigma_A = \frac{1}{2} \left(\begin{bmatrix} 0 \\ -0.16 \end{bmatrix} \begin{bmatrix} 0 & -0.16 \end{bmatrix} + \begin{bmatrix} -0.08 \\ -0.04 \end{bmatrix} \begin{bmatrix} -0.08 & -0.04 \end{bmatrix} + \begin{bmatrix} 0.08 \\ 0.2 \end{bmatrix} \begin{bmatrix} 0.08 & 0.2 \end{bmatrix} \right) = \begin{bmatrix} 6.4 \times 10^{-3} & 9.6 \times 10^{-3} \\ 9.6 \times 10^{-3} & 0.036 \end{bmatrix} \\ \Sigma_B = \frac{1}{3} \left(\begin{bmatrix} -0.0525 \\ -0.2175 \end{bmatrix} \begin{bmatrix} -0.0525 & -0.2175 \end{bmatrix} + \begin{bmatrix} 0.0675 \\ 0.0625 \end{bmatrix} \begin{bmatrix} 0.0675 & 0.0625 \end{bmatrix} + \begin{bmatrix} 0.1675 \\ -0.0475 \end{bmatrix} \begin{bmatrix} 0.1675 & -0.0475 \end{bmatrix} + \begin{bmatrix} -0.1825 \\ 0.2025 \end{bmatrix} \begin{bmatrix} -0.1825 & 0.2025 \end{bmatrix} \right) = \begin{bmatrix} 0.023 & -9.912 \times 10^{-3} \\ -9.912 \times 10^{-3} & 0.031 \end{bmatrix} \end{aligned}$$

As for the other sets of variables, we only need to compute the conditional probabilities regarding classes A and B:

↳ y_3 and y_4

- $P(y_3=0, y_4=0) = \frac{2}{7}$; $P(y_3=1, y_4=0) = \frac{2}{7}$; $P(y_3=0, y_4=1) = \frac{2}{7}$; $P(y_3=1, y_4=1) = \frac{1}{7}$
- Taking these values into consideration, we can now compute the conditional probabilities:

$$P(y_3=0, y_4=0 | y_6=A) = \frac{P(y_6=A | y_3=0, y_4=0) \cdot P(y_3=0, y_4=0)}{P(y_6=A)} = \frac{0 \times \frac{2}{7}}{\frac{3}{7}} = 0; \quad P(y_3=1, y_4=0 | y_6=A) = \frac{1}{3}$$

$$P(y_3=1, y_4=1 | y_6=A) = \frac{1}{3}; \quad P(y_3=0, y_4=1 | y_6=A) = \frac{1}{3} \Rightarrow \text{class A}$$

$$P(y_3=0, y_4=0 | y_6=B) = \frac{1}{2}; \quad P(y_3=1, y_4=0 | y_6=B) = \frac{1}{4}; \quad P(y_3=1, y_4=1 | y_6=B) = 0; \quad P(y_3=0, y_4=1 | y_6=B) = \frac{1}{4}$$

↳ class B

↳ y_5

- $P(y_5=0) = \frac{2}{7}$; $P(y_5=1) = \frac{3}{7}$; $P(y_5=2) = \frac{2}{7}$
- Taking these values into consideration, we can now compute the conditional probabilities:

$$P(y_5=0 | y_6=A) = \frac{P(y_6=A | y_5=0) \cdot P(y_5=0)}{P(y_6=A)} = \frac{\frac{1}{2} \times \frac{2}{7}}{\frac{3}{7}} = \frac{1}{3}; \quad P(y_5=1 | y_6=A) = \frac{1}{3}; \quad P(y_5=2 | y_6=A) = \frac{1}{3}$$

↳ class A

$$P(y_5=0 | y_6=B) = \frac{1}{4}; \quad P(y_5=1 | y_6=B) = \frac{1}{2}; \quad P(y_5=2 | y_6=B) = \frac{1}{4} \Rightarrow \text{class B}$$

With respect to the priors:

- $P(y_6=A) = \frac{3}{7}$
- $P(y_6=B) = \frac{4}{7}$

- (b) Under a Maximum A Posteriori (MAP) assumption

$$\hat{y}_6 = \arg \max_{c_i} \frac{P(x | c_i) \cdot P(c_i)}{P(x)} \Rightarrow \arg \max_{c_i} P(x | c_i) \cdot P(c_i)$$

↳ Classification of x_8

When $c_i = A$:

$$P(x_8 | A) \cdot P(A) \rightarrow \frac{13}{7}$$

$$\rightarrow P(y_1=0.38; y_2=0.52 | y_6=A) \cdot P(y_3=0, y_4=1 | y_6=A) \cdot P(y_5=0 | y_6=A)$$

$$P(y_1=0.38; y_2=0.52 | y_6=A) = \left(\frac{1}{2\pi \sqrt{|\Sigma|}} \right) \cdot \exp \left(-\frac{1}{2} (x-\mu)^T \Sigma^{-1} (x-\mu) \right) * \quad \left| \begin{array}{l} \Sigma = \Sigma_A \\ \mu = \mu_A \end{array} \right.$$

$$\rightarrow N(\mu_A = \begin{bmatrix} 0.24 \\ 0.52 \end{bmatrix}, \Sigma_A = \begin{bmatrix} 6.4 \times 10^{-3} & 7.6 \times 10^{-3} \\ 7.6 \times 10^{-3} & 0.0336 \end{bmatrix})$$

$$\Sigma_A^{-1} = \frac{1}{|\Sigma_A|} \begin{bmatrix} 0.0336 & -7.6 \times 10^{-3} \\ -7.6 \times 10^{-3} & 6.4 \times 10^{-3} \end{bmatrix} = \begin{bmatrix} 273.4375 & -78.125 \\ -78.125 & 52.08(3) \end{bmatrix}$$

$$6.4 \times 10^{-3} \cdot 0.0336 - 7.6 \cdot 10^{-3} \cdot 7.6 \cdot 10^{-3} \approx 0.000123$$

$$\sqrt{|\Sigma_A|} \approx 0.011 \quad \begin{bmatrix} 0.38 \\ 0.52 \end{bmatrix} - \begin{bmatrix} 0.24 \\ 0.52 \end{bmatrix} = \begin{bmatrix} 0.14 \\ 0 \end{bmatrix}$$

$$* = \frac{1}{2\pi \times 0.011} \exp \left(-\frac{1}{2} \begin{bmatrix} 0.14 & 0 \end{bmatrix} \begin{bmatrix} 273.4375 & -78.125 \\ -78.125 & 52.08(3) \end{bmatrix} \begin{bmatrix} 0.14 \\ 0 \end{bmatrix} \right) \approx 0.992$$

$$\text{and thus, } P(x_8|A) \cdot P(A) = 0.992 \times \frac{1}{3} \times \frac{1}{3} \times \frac{3}{7} \approx 0.047$$

when $c_i = B$:

$$P(x_8|B) \cdot P(B) \rightarrow \frac{4}{7}$$

$$\rightarrow P(y_1=0.38; y_2=0.52 | y_6=B) \cdot P(y_3=0, y_4=1 | y_6=B) \cdot P(y_5=0 | y_6=B)$$

$$P(y_1=0.38; y_2=0.52 | y_6=B) = \frac{1}{2\pi \times 0.0248} \exp \left(-\frac{1}{2} \begin{bmatrix} -0.2125 & 0.1925 \end{bmatrix} \begin{bmatrix} 50.427 & 16.124 \\ 16.124 & 37.413 \end{bmatrix} \begin{bmatrix} -0.2125 \\ 0.1925 \end{bmatrix} \right) ** \quad \left| \begin{array}{l} \Sigma = \Sigma_B \\ \mu = \mu_B \end{array} \right.$$

$$\rightarrow N(\mu_B = \begin{bmatrix} 0.5925 \\ 0.3275 \end{bmatrix}, \Sigma_B = \begin{bmatrix} 0.023 & -9.912 \times 10^{-3} \\ -9.912 \times 10^{-3} & 0.031 \end{bmatrix})$$

$$\Sigma_B^{-1} = \begin{bmatrix} 50.427 & 16.124 \\ 16.124 & 37.413 \end{bmatrix} \quad |\Sigma_B| = 0.000615 \quad \sqrt{|\Sigma_B|} \approx 0.0248 \quad \begin{bmatrix} 0.38 \\ 0.52 \end{bmatrix} - \begin{bmatrix} 0.5925 \\ 0.3275 \end{bmatrix} = \begin{bmatrix} -0.2125 \\ 0.1925 \end{bmatrix}$$

$$** \approx 1.987$$

$$\text{and thus, } P(x_8|B) \cdot P(B) = 1.987 \times \frac{1}{4} \times \frac{1}{4} \times \frac{4}{7} \approx 0.0710$$

Since $P(x_8|B) \cdot P(B) > P(x_8|A) \cdot P(A) \Leftrightarrow 0.0710 > 0.047$, we can conclude that x_8 is classified as B.

\rightarrow classification of x_9

when $c_i = A$:

$$P(x_9|A) \cdot P(A) \rightarrow \frac{3}{7}$$

$$\rightarrow P(y_1=0.42; y_2=0.59 | y_6=A) \cdot P(y_3=0, y_4=1 | y_6=A) \cdot P(y_5=1 | y_6=A)$$

$$P(y_1=0.42; y_2=0.59 | y_6=A) = \frac{1}{2\pi \times 0.011} \exp \left(-\frac{1}{2} \begin{bmatrix} 0.18 & 0.07 \end{bmatrix} \begin{bmatrix} 273.4375 & -78.125 \\ -78.125 & 52.08(3) \end{bmatrix} \begin{bmatrix} 0.18 \\ 0.07 \end{bmatrix} \right) \approx \begin{bmatrix} 0.42 \\ 0.59 \end{bmatrix} - \begin{bmatrix} 0.24 \\ 0.52 \end{bmatrix} = \begin{bmatrix} 0.18 \\ 0.07 \end{bmatrix}$$

$$\approx 0.406$$

$$\text{and thus } P(x_9|A) \cdot P(A) = 0.406 \times \frac{1}{3} \times \frac{1}{3} \times \frac{3}{7} \approx 0.019$$

when $c_i = B$:

$$P(x_9|B) \cdot P(B) \rightarrow \frac{4}{7}$$

$$\rightarrow P(y_1=0.42; y_2=0.59 | y_6=B) \cdot P(y_3=0, y_4=1 | y_6=B) \cdot P(y_5=1 | y_6=B)$$

$$P(y_1=0.42; y_2=0.59 | y_6=B) = \frac{1}{2\pi \times 0.0248} \exp \left(-\frac{1}{2} \begin{bmatrix} -0.1725 & 0.2625 \end{bmatrix} \begin{bmatrix} 50.427 & 16.124 \\ 16.124 & 37.413 \end{bmatrix} \begin{bmatrix} -0.1725 \\ 0.2625 \end{bmatrix} \right) = \begin{bmatrix} 0.42 \\ 0.59 \end{bmatrix} - \begin{bmatrix} 0.5925 \\ 0.3275 \end{bmatrix} = \begin{bmatrix} -0.1725 \\ 0.2625 \end{bmatrix}$$

$$\approx 1.733$$

$$\text{and thus } P(x_9|B) \cdot P(B) = 1.733 \times \frac{1}{4} \times \frac{1}{2} \times \frac{4}{7} \approx 0.124$$

Since $P(x_9|B) \cdot P(B) > P(x_9|A) \cdot P(A) \Leftrightarrow 0.124 > 0.019$, we can conclude that x_9 is classified as B.

(c) under a Maximum Likelihood (ML) assumption

$$\hat{y}_c = \arg \max_{c_i} P(x|c_i)$$

and thus:

$$x_8 \rightarrow P(x_8|A) = 0.992 \times \frac{1}{3} \times \frac{1}{3} = 0.110 \leftarrow \text{observation with } y_c = A \text{ with lowest } P(x_i|A)$$

$$x_9 \rightarrow P(x_9|A) = 0.406 \times \frac{1}{3} \times \frac{1}{3} = 0.045 \leftarrow \text{observation with } y_c = B \text{ with lowest } P(x_i|A)$$

In conclusion, in order to optimize testing accuracy, $\theta \in]0, 172; 0, 470[$.

normalization

$$P(x_8|A) = \frac{0.110}{0.110 + 0.124} \approx 0.470$$

$$P(x_9|A) = \frac{0.045}{0.217 + 0.045} \approx 0.172$$

$$P(x_9|B)$$

②

(a)

$$\bar{y}_2 = 0.4422$$

$$\min y_2 = 0.11 \quad \max y_2 = 0.72 \quad \left. \begin{array}{l} \text{range } y_2 = 1 - 0 = 1 \\ \Rightarrow \text{range} = \frac{1}{2} = 0.5 \end{array} \right\}$$

$$\hat{y}_{2, \text{new}} = 0 \Rightarrow y_2 \in [0; 0.5[\quad y_2 = [001000111]$$

$$\hat{y}_{2, \text{new}} = 1 \Rightarrow y_2 \in [0.5; 1] \quad y_2 = [001000111]$$

Folds:

↳ #1

$$x_1 \rightarrow y_2 = 0, y_3 = 1, y_4 = 1, y_5 = 0, y_6 = A$$

$$x_2 \rightarrow y_2 = 0, y_3 = 1, y_4 = 0, y_5 = 1, y_6 = A$$

$$x_3 \rightarrow y_2 = 1, y_3 = 0, y_4 = 1, y_5 = 2, y_6 = A$$

↳ #2

$$x_4 \rightarrow y_2 = 0, y_3 = 0, y_4 = 0, y_5 = 1, y_6 = B$$

$$x_5 \rightarrow y_2 = 0, y_3 = 0, y_4 = 0, y_5 = 0, y_6 = B$$

$$x_6 \rightarrow y_2 = 0, y_3 = 1, y_4 = 0, y_5 = 2, y_6 = B$$

↳ #3

$$x_7 \rightarrow y_2 = 1, y_3 = 0, y_4 = 1, y_5 = 1, y_6 = B$$

$$x_8 \rightarrow y_2 = 1, y_3 = 0, y_4 = 1, y_5 = 0, y_6 = A$$

$$x_9 \rightarrow y_2 = 1, y_3 = 0, y_4 = 1, y_5 = 1, y_6 = B$$

(b) training observations: $x_1 - x_6$ (folds 1 and 2)

testing observations: $x_7 - x_9$ (fold 3)

$$\text{Hamming distance: } d(x_i, x_j) = \sum_{k=1}^6 y_{ki} \neq y_{kj} \quad w_i = \frac{1}{d(x_i, x_1)} \quad w_i' = \frac{w_i}{\sum w_i}$$

$$x_7: d(x_7, x_1) = 4$$

$$d(x_7, x_2) = 4$$

$$d(x_7, x_3) = 2$$

$$d(x_7, x_4) = 2$$

$$d(x_7, x_5) = 3$$

$$d(x_7, x_6) = 4$$

$$d(x_7, x_1) = 4$$

$$d(x_7, x_2) = 4$$

$$d(x_7, x_3) = 2$$

$$d(x_7, x_4) = 2$$

$$d(x_7, x_5) = 3$$

$$d(x_7, x_6) = 4$$

II. Programming and critical analysis

1)

a) Code and graphs:

```
import pandas as pd
from scipy.io.arff import loadarff

data = loadarff('column_diagnosis.arff')
df = pd.DataFrame(data[0])
df['class'] = df['class'].str.decode('utf-8')
df.head()

from sklearn import metrics
from sklearn.neighbors import KNeighborsClassifier
from sklearn.naive_bayes import GaussianNB

from sklearn.model_selection import StratifiedKFold

input_vars = df.drop("class", axis=1)
output_vars = df["class"]

knn_classifier = KNeighborsClassifier(n_neighbors=5)
naive_bayes_calssifier = GaussianNB()

folds = StratifiedKFold(n_splits=10, shuffle=True, random_state=0)
knn_fold accuracies = []
naive_bayes_fold accuracies = []
for train_k, test_k in folds.split(input_vars, output_vars):
    X_train, X_test = input_vars.iloc[train_k], input_vars.iloc[test_k]
    y_train, y_test = output_vars.iloc[train_k], output_vars.iloc[test_k]

    knn_classifier.fit(X_train, y_train)
    y_pred = knn_classifier.predict(X_test)
    knn_fold accuracies.append(round(metrics.accuracy_score(y_test,
y_pred),2))

    naive_bayes_calssifier.fit(X_train, y_train)
    y_pred = naive_bayes_calssifier.predict(X_test)
    naive_bayes_fold accuracies.append(round(metrics.accuracy_score(y_test,
y_pred),2))

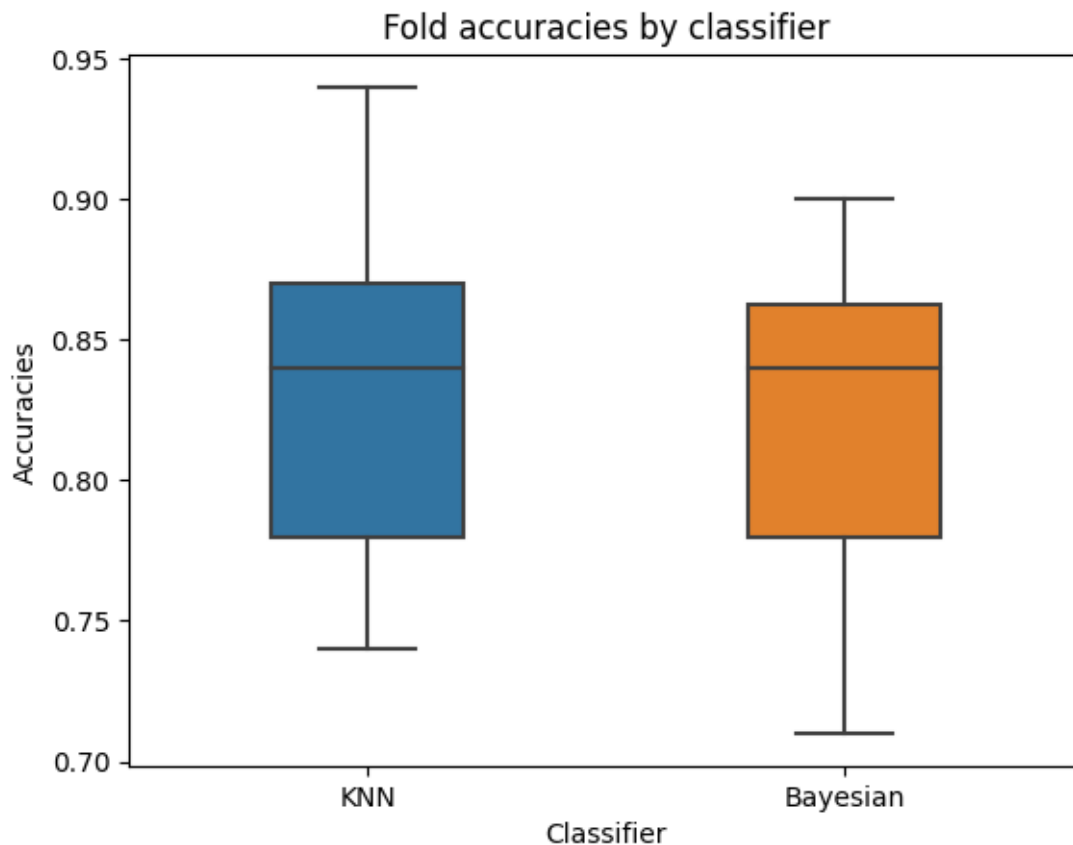

print(knn_fold accuracies)
print(naive_bayes_fold accuracies)

[0.94, 0.81, 0.87, 0.94, 0.74, 0.87, 0.84, 0.84, 0.77, 0.77]
```

```
[0.84, 0.87, 0.84, 0.87, 0.77, 0.84, 0.9, 0.81, 0.77, 0.71]
```

```
import matplotlib.pyplot as plt
import seaborn as sns
```

```
df = pd.DataFrame({'Accuracies':
knn_fold_accuracies+naive_bayes_fold_accuracies, 'Classifier':
["KNN"]*10+["Bayesian"]*10})
sns.boxplot(data=df, x='Classifier', y='Accuracies',
width=0.4).set(title='Fold accuracies by classifier')
plt.show()
```

b) Code and comments:

```
from scipy.stats import ttest_rel
```

```
test_results = ttest_rel(knn_fold_accuracies, naive_bayes_fold_accuracies,
alternative='less')
print(test_results)
```

```
TtestResult(statistic=0.9923982173934255, pvalue=0.8265333762138204, df=9)
```

Since our alternative hypothesis is the KNN accuracy mean being less than the Bayesian accuracy mean and the value obtained is about 82,70%, we can't reject the alternative hypothesis for standard significance levels, so we can't certainly assume that the null hypothesis is true.

2) Code, graphs and comments:

```
from sklearn.metrics import confusion_matrix
from functools import reduce

knn_classifier_1 = KNeighborsClassifier(n_neighbors=1, metric="euclidean")
knn_classifier_5 = KNeighborsClassifier(n_neighbors=5, metric="euclidean")

confusion_matrix_knn1 = []
confusion_matrix_knn5 = []
for train_k, test_k in folds.split(input_vars, output_vars):
    X_train, X_test = input_vars.iloc[train_k], input_vars.iloc[test_k]
    y_train, y_test = output_vars.iloc[train_k], output_vars.iloc[test_k]

    knn_classifier_1.fit(X_train, y_train)
    y_pred = knn_classifier_1.predict(X_test)
    cm = confusion_matrix(y_test, y_pred, labels=["Hernia" , "Normal",
"Spondylolisthesis"])
    confusion_matrix_knn1.append(cm)

    knn_classifier_5.fit(X_train, y_train)
    y_pred = knn_classifier_5.predict(X_test)
    cm = confusion_matrix(y_test, y_pred, labels=["Hernia" , "Normal",
"Spondylolisthesis"])
    confusion_matrix_knn5.append(cm)

cumulative_cm_knn1 = (reduce(lambda a,b: a+b, confusion_matrix_knn1))
cumulative_cm_knn5 = (reduce(lambda a,b: a+b, confusion_matrix_knn5))

print(cumulative_cm_knn1)
print(cumulative_cm_knn5)

diff_cm = cumulative_cm_knn1 - cumulative_cm_knn5

ax = sns.heatmap(diff_cm, annot=True, cmap='Blues')

ax.set_title('Difference between KNN1 and KNN5 Confusion Matrices\n')
ax.set_xlabel('\nPredicted Values')
ax.set_ylabel('Actual Values ')

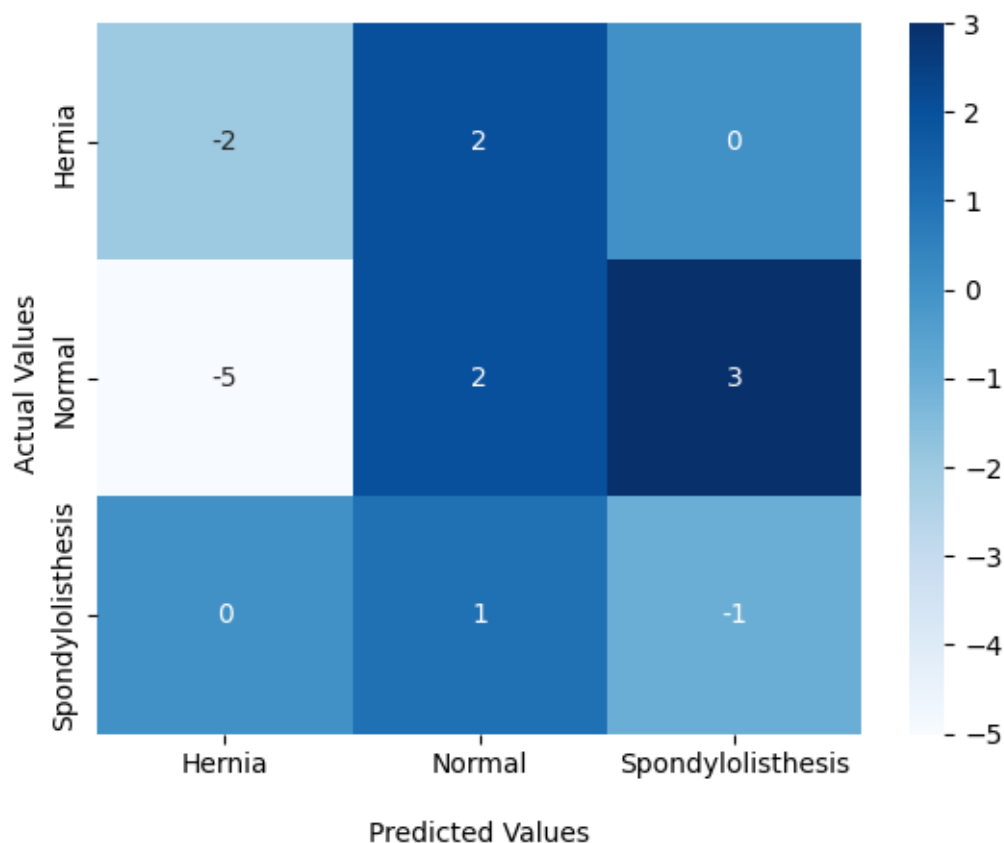

## Ticket labels - List must be in alphabetical order
```

```
ax.xaxis.set_ticklabels(["Hernia", "Normal", "Spondylolisthesis"])
ax.yaxis.set_ticklabels(["Hernia", "Normal", "Spondylolisthesis"])
```

```
## Display the visualization of the Confusion Matrix.
plt.show()
```

```
[[ 37  23   0]
 [ 14  80   6]
 [   1   7 142]]
[[ 39  21   0]
 [ 19  78   3]
 [   1   6 143]]
```

Difference between KNN1 and KNN5 Confusion Matrices

Comment:

As a result of our analysis of the previous plot, it can be deduced that there isn't much of a difference between the observations registered using KNN1 and KNN5 (it goes neither under -5 nor more than 2) and thus both approaches end up having similar behaviour.

3)

When learning a naive Bayes model from the column diagnosis dataset, we assume independence among every input variable, which may or may not be true, because we don't know how these variables are related and this could lead to incorrect results (e.g., there are three features related to "pelvis", so they're more likely to be associated with each other than not). Additionally, our dataset only has continuous features and thus our results may not be optimal as some of these features may not follow a Gaussian distribution — an assumption made by Naïve Bayes. This model is also affected by the presence of extraneous data and/or variables and may give them undue importance when making predictions.
